

# PASSWORD SAFE + PRIVILEGED REMOTE ACCESS

PROTECT PRIVILEGED ACCOUNTS AND ACCESS TO YOUR CRITICAL INFRASTRUCTURE

## Discover & Manage Accounts

Ensure all privileged accounts are continuously identified, automatically onboarded, and placed under management

## Control Privileged Access

Limit vendor and insider access via granular, role-based access to specific systems, without sacrificing productivity

## Achieve Compliance

Audit privileged user activity and meet compliance requirements

Organizations are constantly at risk of security breaches with an ever-expanding threat landscape. To maintain a strong security posture, they must safeguard access to their most sensitive assets while enabling the speed and agility required in today's digital enterprise.

## Better Together — Privileged Account & Session Management and Third-Party Access Control

Password Safe and Privileged Remote Access work together to mitigate the risks associated with credential theft or misuse and unmanaged access from third-party and internal users. The solution enables unmatched visibility and control over your most sensitive assets without hindering productivity.

- **Continuously Discover and Onboard Privileged Accounts:** Leverage a distributed network discovery engine to scan, identify, and profile all assets - automatically. This dynamic categorization allows auto-onboarding and the ability for access policies to self-adjust according to environmental changes. This automated process reduces time and administrative overhead and helps ensure no system is left unmanaged.
- **Manage Privileged Credentials:** Store and manage privileged account credentials in a centralized safe to reduce the risk of unauthorized access. Leverage propagation of password changes in bulk to a comprehensive set of targets and down to services, and schedule bulk rotation of credentials across various platforms, beyond MS Windows. This broad platform rotation and propagation ensures all your critical processes and assets are secure and available.
- **Control Privileged Access:** Manage and control third-party and insider access to sensitive systems via granular, role-based access - no VPNs required. Enforce least privilege by giving users the right level of access. By controlling and auditing vendor and internal access across a variety of environments, organizations improve their overall security posture and meet compliance mandates.
- **Monitor Privileged Sessions:** Manage privileged sessions using a variety of standard protocols for RDP, VNC, HTTP/S, and SSH connections. Control the access to and from any platform in any environment, and eliminate inefficient workflows related to manual check-in and check-out of credentials. This approach gives you unmatched flexibility to monitor sensitive assets without harming productivity.

**Together, Password Safe and Privileged Remote Access enable organizations to mitigate the risk associated with credential compromise and unmanaged privileged access.**

**BEYONDTRUST ENABLES YOUR ORGANIZATION TO:**

- Remove the overhead of managing a VPN for external, third-parties, vendors or remote privileged users
- Standardize on a single remote access tool to eliminate tracking various tools in your environment
- Empower remote privileged users that need to perform privileged sessions from mobile devices
- Foster collaboration between privileged users in single or multiple sessions
- Leverage appliance or cloud-based deployment
- Rely on hardened appliances with FIPS 140-2-validated components

BeyondTrust is the worldwide leader in Privileged Access Management (PAM), empowering companies to secure and manage their entire universe of privileges. The BeyondTrust Universal Privilege Management approach secures and protects privileges across passwords, endpoints, and access, giving organizations the visibility and control they need to reduce risk, achieve compliance, and boost operational performance.
